Question 5 (12 marks)

A waterskier moves from side to side behind a speedboat that is travelling in a straight line along a still lake.

The position vector of the waterskier relative to a fixed observation point on the shore of the lake is given by

\[ \mathbf{r}(t) = 7.5t \mathbf{i} + \left( 50 - 10 \sin \left( \frac{\pi t}{6} \right) \right) \mathbf{j} \]

The components of the position vector are measured in metres, where \( \mathbf{i} \) is a unit vector in the direction of motion of the speedboat, and \( \mathbf{j} \) is a unit vector perpendicular to \( \mathbf{i} \) to the left of the direction of motion of the speedboat. The diagram below represents the view from above.

---

a. Find \( \mathbf{v}(t) \) and hence determine the minimum and maximum speeds of the waterskier.

Give your answers in metres per second, correct to one decimal place.  

b. Find the times when the acceleration of the waterskier is zero.
Later, the waterskier performs a jump from the top of a 10 m long ramp, which is inclined at 30° to the horizontal. To do this, the speedboat travels beside the ramp and keeps the waterskier’s speed at 15 m/s directly up the ramp, until the waterskier reaches the top. Then the speedboat slows, so that the tow rope slackens and remains slack after the waterskier leaves the top of the ramp. Assume negligible air resistance on the waterskier, who is then subject only to the force of gravity.

![Diagram of the ramp and speedboat](image)

c. Find the time it takes for the waterskier to hit the water after leaving the top of the ramp. Give your answer in seconds, correct to the nearest one hundredth of a second.

d. After leaving the top of the ramp, how far in the horizontal direction does the waterskier travel before hitting the water? Give your answer in metres, correct to the nearest metre.  

1 mark
When attempting a second jump, the waterskier accidentally drops the tow rope when beginning to ascend the ramp and skids directly up the ramp with an initial velocity of 10 m/s.

e. Find how far up the ramp the waterskier travels before coming to a stop, if the coefficient of friction between the skis and the ramp is $\mu = \frac{1}{8\sqrt{3}}$.

Give your answer in metres, correct to one decimal place.  

f. The waterskier comes to a stop on the ramp.

\[ \frac{d}{dx}(\cos(ax)) = -a \sin(ax) \quad \int \cos(ax) \, dx = \frac{1}{a} \sin(ax) + c \]

\[ \frac{d}{dx}(\tan(ax)) = a \sec^2(ax) \quad \int \sec^2(ax) \, dx = \frac{1}{a} \tan(ax) + c \]

\[ \frac{d}{dx}(\sin^{-1}(x)) = \frac{1}{\sqrt{1-x^2}} \quad \int \frac{1}{\sqrt{a^2-x^2}} \, dx = \sin^{-1} \left( \frac{x}{a} \right) + c, \quad a > 0 \]

\[ \frac{d}{dx}(\cos^{-1}(x)) = -\frac{1}{\sqrt{1-x^2}} \quad \int -\frac{1}{\sqrt{a^2-x^2}} \, dx = \cos^{-1} \left( \frac{x}{a} \right) + c, \quad a > 0 \]

\[ \frac{d}{dx}(\tan^{-1}(x)) = \frac{1}{1+x^2} \quad \int \frac{a}{a^2+x^2} \, dx = \tan^{-1} \left( \frac{x}{a} \right) + c \]

product rule:

\[ \frac{d}{dx}(uv) = u \frac{dv}{dx} + v \frac{du}{dx} \]

quotient rule:

\[ \frac{d}{dx} \left( \frac{u}{v} \right) = \frac{v \frac{du}{dx} - u \frac{dv}{dx}}{v^2} \]

chain rule:

\[ \frac{dy}{dx} = \frac{dy}{du} \frac{du}{dx} \]

Euler’s method:

If \( \frac{dy}{dx} = f(x) \), \( x_0 = a \) and \( y_0 = b \), then \( x_{n+1} = x_n + h \) and \( y_{n+1} = y_n + hf(x_n) \)

acceleration:

\[ a = \frac{d^2x}{dt^2} = \frac{dv}{dt} = \frac{dy}{dx} = \frac{d}{dx} \left( \frac{1}{2}v^2 \right) \]

constant (uniform) acceleration:

\[ v = u + at \quad s = ut + \frac{1}{2}at^2 \quad v^2 = u^2 + 2as \quad s = \frac{1}{2} (u + v)t \]
