Question 1
Adam (aged 40) and his son Jed (aged 3) enjoy reading stories together. Jed’s development is predictable for his age.

a. Explain three ways that reading together may contribute to the social and/or emotional development of Adam and Jed.

\[3 \times 2 = 6 \text{ marks}\]

b. Describe two characteristics of physical development that would be expected for Jed. Discuss how these characteristics may affect his social and emotional development.

\[2 \times 4 = 8 \text{ marks}\]

Total 14 marks

(suggested time: 15 minutes)

Question 2

a. Using the information provided in the table below, explain the need for the differences in protein, calcium and iron intakes for each of the groups shown.

\[3 \times 4 = 12 \text{ marks}\]

Recommended dietary intakes (RDIs) for use in Australia (expressed as mean daily intakes) by group, 1991

b. Identify one environmental factor and one genetic factor and describe how they may affect the physical development of an embryo/foetus.

\[2 \times 3 = 6 \text{ marks}\]

c. Identify and explain how one biomedical approach may enhance the health of a pregnant woman and her embryo/foetus.

3 marks

Total 21 marks

(suggested time: 30 minutes)
Question 3
Mental health has been identified as one of the National Health Priority Action areas. Within mental health, depression is a leading cause of illness and disability. Depression is characterised by feelings of sadness and periods of low moods. Depression has been identified by the government as the first priority for action.

a. Describe three examples of development that are characteristic of young adulthood.

b. Discuss how depression might impact on the physical, social and emotional health and/or development of young adults.

c. Outline two possible consequences for the community of young adults experiencing depression.

---

Question 4
Diabetes is the 7th major cause of death in Australia and it is estimated to affect 1.6 million people in the next decade. The prevalence of diabetes among indigenous Australians (Aboriginal and Torres Strait Islanders) is about two to four times greater than that of non-indigenous Australians.

Source: Diabetes Fact Sheet, Commonwealth Department of Health and Aged Care
(last updated August 2001)

a. Describe three food selection factors that may account for the prevalence of diabetes among all Australians.

b. A key goal of governments is maintaining and promoting public health. Explain how governments could redress the high prevalence of diabetes in indigenous Australians to meet this goal.

c. Identify and describe a preventive approach that could be used to decrease the prevalence of diabetes among all Australians. Justify how this approach may be more effective than biomedical approaches in reducing the prevalence of diabetes in Australia.

TURN OVER
Question 5

Malnutrition is one of today’s most serious global public health problems. Both obesity and undernutrition (underweight) contribute to this problem as shown in the figure below.

Adult population affected by underweight and obesity by level of development (estimates for the year 2000)

a. Explain two reasons that may account for the global prevalence of obesity.
   
   2 × 2 = 4 marks

b. Identify two consequences of undernutrition for the health and/or development of people in developing countries.
   
   2 × 2 = 4 marks

c. The World Health Organisation (WHO) is developing strategies aimed at reducing malnutrition. Describe one strategy you would suggest they use to reduce the prevalence of obesity in a developing country. Explain why this strategy should be used.
   
   2 + 5 = 7 marks

Total 15 marks

(suggested time: 25 minutes)
